DESCRIPTORS: *Brick, *Glass, Chemical reactions.

When a fireclay body reacts with a limited amount of
stagnant glass, the glass is locally impoverished in
alkali, and the striae originating there exhibit the char-
acteristic aluminous layers as well as those im-
pooverished in alkali, i.e. enriched in SiO_2 . This can
be demonstrated in the glass from a cavity in a floaters.
The threads from such a hollow space normally have an
aluminous core and an envelope of which the SiO_2 con-
tent is increased by 0.5 to 1%. (Author)
